(54) Title: NEW COMPOUNDS

(57) Abstract: The present invention relates to new compounds of formula (I) wherein Y, P, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, n, m are defined as in claim 1, a process for their preparation and new intermediates used therein, pharmaceutical composition containing said therapeutically active compounds and to the use of said active compounds in therapy, especially in the prevention and/or treatment of dementia related diseases, Alzheimer's Disease and conditions associated with glycogen synthase kinase-3.

## NEW COMPOUNDS

## FIELD OF THE INVENTION

5 The present invention relates to new compounds of formula I, as a free base or salts thereof, to pharmaceutical composition containing said compounds and to the use of said compounds in therapy. The present invention further relates to processes for the preparation of compounds of formula I and to new intermediates used in the preparation thereof.

10

## BACKGROUND OF THE INVENTION

Glycogen synthase kinase 3 (GSK3) is a serine / threonine protein kinase composed of two isoforms ( $\alpha$  and  $\beta$ ), which are encoded by distinct genes but are highly homologous within the catalytic domain. GSK3 is highly expressed in the central and peripheral nervous system. GSK3 phosphorylates several substrates including tau,  $\beta$ -catenin, glycogen synthase, pyruvate dehydrogenase and elongation initiation factor 2b (eIF2b). Insulin and growth factors activate protein kinase B, which phosphorylates GSK3 on the serine 9 residue and inactivates it.

20

### *Alzheimer's Disease (AD) dementias, and tauopathies.*

AD is characterized by cognitive decline, cholinergic dysfunction and neuronal death, neurofibrillary tangles and senile plaques consisting of amyloid- $\beta$  deposits. The sequence of these events in AD is unclear, but believed to be related. Glycogen synthase kinase 3 $\beta$  (GSK3 $\beta$ ) or Tau ( $\tau$ ) phosphorylating kinase selectively phosphorylates the microtubule associated protein  $\tau$  in neurons at sites that are hyperphosphorylated in AD brains. Hyperphosphorylated protein  $\tau$  has lower affinity for microtubules and accumulates as paired helical filaments, which are the main components that constitute neurofibrillary tangles and neuropil threads in AD brains. This results in depolymerization of microtubules, which leads to dying back of axons and neuritic dystrophy. Neurofibrillary tangles are consistently found in diseases such as AD, amyotrophic lateral sclerosis,

30

parkinsonism-dementia complex of Gaum, corticobasal degeneration, dementia pugilistica and head trauma, Down's syndrome, postencephalatic parkinsonism, progressive supranuclear palsy, Niemann-Pick's Disease and Pick's Disease. Addition of amyloid- $\beta$  to primary hippocampal cultures results in hyperphosphorylation of  $\tau$  and a paired helical  
5 filaments-like state via induction of GSK3 $\beta$  activity, followed by disruption of axonal transport and neuronal death (Imahori and Uchida., J. Biochem 121:179-188, 1997). GSK3 $\beta$  preferentially labels neurofibrillary tangles and has been shown to be active in pre-tangle neurons in AD brains. GSK3 protein levels are also increased by 50% in brain tissue from AD patients. Furthermore, GSK3 $\beta$  phosphorylates pyruvate dehydrogenase, a key  
10 enzyme in the glycolytic pathway and prevents the conversion of pyruvate to acetyl-Co-A (Hoshi et al., PNAS 93:2719-2723, 1996). Acetyl-Co-A is critical for the synthesis of acetylcholine, a neurotransmitter with cognitive functions. Thus, GSK3 $\beta$  inhibition may have beneficial effects in progression as well as the cognitive deficits associated with Alzheimer's disease and other above-referred to diseases.

15

*Chronic and Acute Neurodegenerative Diseases.*

Growth factor mediated activation of the PI3K /Akt pathway has been shown to play a key role in neuronal survival. The activation of this pathway results in GSK3 $\beta$  inhibition. Recent studies (Bhat et. al., PNAS 97:11074-11079 (2000)) indicate that GSK3 $\beta$  activity is  
20 increased in cellular and animal models of neurodegeneration such as cerebral ischemia or after growth factor deprivation. For example, the active site phosphorylation was increased in neurons vulnerable to apoptosis, a type of cell death commonly thought to occur in chronic and acute degenerative diseases such as Alzheimer's Disease, Parkinson's Disease, amyotrophic lateral sclerosis, Huntington's Disease and HIV dementia, ischemic stroke  
25 and head trauma. Lithium was neuroprotective in inhibiting apoptosis in cells and in the brain at doses that resulted in the inhibition of GSK3 $\beta$ . Thus, GSK3 $\beta$  inhibitors could be useful in attenuating the course of neurodegenerative diseases.

*Bipolar Disorders (BD)*

Bipolar Disorders are characterised by manic episodes and depressive episodes. Lithium has been used to treat BD based on its mood stabilising effects. The disadvantage of lithium is the narrow therapeutic window and the danger of overdosing, that can lead to  
5 lithium intoxication. The recent discovery that lithium inhibits GSK3 at therapeutic concentrations has raised the possibility that this enzyme represents a key target of lithium's action in the brain (Stambolic et al., Curr. Biol. 6:1664-1668, 1996; Klein and Melton; PNAS 93:8455-8459, 1996). Inhibition of GSK3 $\beta$  may therefore be of therapeutic relevance in the treatment of BD as well as in AD patients that have affective disorders.

10

*Schizophrenia*

GSK3 is involved in signal transduction cascades of multiple cellular processes, particularly during neural development. Kozlovsky et al (Am J Psychiatry 2000 May;157(5):831-3) found that GSK3 $\beta$  levels were 41% lower in the schizophrenic patients  
15 than in comparison subjects. This study indicates that schizophrenia involves neurodevelopmental pathology and that abnormal GSK3 regulation could play a role in schizophrenia. Furthermore, reduced  $\beta$ -catenin levels have been reported in patients exhibiting schizophrenia (Cotter et al., Neuroreport 9:1379-1383 (1998)).

20 *Diabetes*

Insulin stimulates glycogen synthesis in skeletal muscles via the dephosphorylation and thus activation of glycogen synthase. Under resting conditions, GSK3 phosphorylates and inactivates glycogen synthase via dephosphorylation. GSK3 is also over-expressed in muscles from Type II diabetic patients (Nikoulina et al., Diabetes 2000 Feb;49(2):263-71).  
25 Inhibition of GSK3 increases the activity of glycogen synthase thereby decreasing glucose levels by its conversion to glycogen. GSK3 inhibition may therefore be of therapeutic relevance in the treatment of Type I and Type II diabetes and diabetic neuropathy.

*Hair Loss*

30 GSK3 phosphorylates and degrades  $\beta$ -catenin.  $\beta$ -catenin is an effector of the pathway for keratin synthesis.  $\beta$ -catenin stabilisation may lead to increase hair development. Mice expressing a stabilised  $\beta$ -catenin by mutation of sites phosphorylated by GSK3 undergo a

process resembling de novo hair morphogenesis (Gat et al., Cell 1998 Nov 25;95 (5):605-14)). The new follicles formed sebaceous glands and dermal papilla, normally established only in embryogenesis. Thus GSK3 inhibition may offer treatment for baldness.

5 *Oral contraceptives*

Vijayaraghavan et al. (Biol Reprod 2000 Jun; 62 (6):1647-54) reported that GSK3 is high in motile versus immotile sperm. Immunocytochemistry revealed that GSK3 is present in the flagellum and the anterior portion of the sperm head. These data suggest that GSK3 could be a key element underlying motility initiation in the epididymis and regulation of  
10 mature sperm function. Inhibitors of GSK3 could be useful as contraceptives for males.

DISCLOSURE OF THE INVENTION.

15 The object of the present invention is to provide compounds having a selective inhibiting effect at GSK3 as well as having a good bioavailability.

Accordingly, the present invention provides a compound of formula I

For the avoidance of any doubt, it is to be understood that when  $X^2$  is, for example, a group of formula  $NR^{11}CO$ , it is the nitrogen atom bearing the  $R^{11}$  group which is attached to the quinazoline ring and the carbonyl (CO) group is attached to  $R^{10}$ , whereas when  $X^2$  is, for example, a group of formula  $CONR^{12}$ , it is the carbonyl group which is attached to the quinazoline ring and the nitrogen atom bearing the  $R^{12}$  group is attached to  $R^{10}$ . A similar convention applies to the other two atoms  $X^2$  linking groups such as  $NR^{14}SO_2$  and  $SO_2NR^{13}$ . When  $X^2$  is  $NR^{15}$  it is the nitrogen atom bearing the  $R^{15}$  group, which is linked to the quinazoline ring and to  $R^{10}$ . An analogous convention applies to other groups. It is further to be understood that when  $X^2$  represents  $NR^{15}$  and  $R^{15}$  is  $C_{1-3}alkoxyC_{2-3}alkyl$  it is

the C<sub>2-3</sub>alkyl moiety, which is linked to the nitrogen atom of X<sup>2</sup> and an analogous convention applies to other groups.

For the avoidance of any doubt, it is to be understood that in a compound of formula I when R<sup>10</sup> is, for example, a group of formula C<sub>1-5</sub>alkylX<sup>10</sup>C<sub>1-5</sub>alkylR<sup>34</sup>, it is the terminal C<sub>1-5</sub>alkyl moiety which is linked to X<sup>10</sup>, similarly when R<sup>10</sup> is, for example, a group of formula C<sub>2-5</sub>alkenylR<sup>34</sup> it is the C<sub>2-5</sub>alkenyl moiety which is linked to X<sup>2</sup> and an analogous convention applies to other groups.

For the avoidance of any doubt, it is to be understood that when R<sup>34</sup> carries a C<sub>1-4</sub>aminoalkyl substituent it is the C<sub>1-4</sub>alkyl moiety, which is attached to R<sup>34</sup> whereas when R<sup>34</sup> carries a C<sub>1-4</sub>alkylamino substituent it is the amino moiety, which is attached to R<sup>39</sup> and an analogous convention applies to other groups.

For the avoidance of any doubt when X<sup>1</sup> is C<sub>2-4</sub>alkanoyl it is the carbonyl moiety, which is linked to the heteroaromatic oxindole group and it is the alkyl moiety, which is linked to R<sup>4</sup> and an analogous convention applies to other groups.

Conventional procedures for using such protecting groups as well as examples of suitable protecting groups are described, for example, in "Protective Groups in Organic Synthesis" T.W. Greene, P.G.M. Wuts, Wiley-Interscience, New York, 1999.

Such a base may be chosen from the group of organic amine bases such as pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, morpholine, *N*-methylmorpholine or diazabicyclo[5.4.0]undec-7-ene, tetramethylguanidine or an alkali metal or alkaline earth metal carbonate or hydroxide such as sodium carbonate, potassium carbonate, calcium carbonate, sodium hydroxide or potassium hydroxide. #### 6-(2-Methoxyethoxy)isoquinolin-1-ol

25 To 3-(2-methoxyethoxy)benzaldehyde (7.35 g, 40.6 mmol) and pyridine (65 mL) were added malonic acid (8.5 g, 81.7 mmol) and piperidine (4 mL, 40.6 mmol). The resulting yellow solution was heated at 80 °C under nitrogen atmosphere. Gas evolved as the reaction proceeded. After 2.5 h the reaction was allowed to cool down to room temperature and stirring was continued over night. The reaction solution was concentrated *in vacuo* to  
30 give an oil. The oil was stirred with ice and triturated by slow addition of hydrochloric acid (12 M, 13 mL). The resulting yellow precipitate was filtered and washed with aqueous hydrochloric acid (2 M, 3x20 mL). The pale yellow solid obtained was dried *in vacuo* to

give 8.7 g. The solid (8.7 g, 39.2 mmol) was dissolved in thionyl chloride (70 mL) and *N,N*-dimethylformamide (5 mL) and was refluxed under nitrogen atmosphere over night. After 16 h, the reaction solution was cooled to room temperature and concentrated *in vacuo*. The residue was taken up in dioxane (15 mL) and the resulting solution was added dropwise to a stirred solution of sodium azide (7.6 g, 118 mmol) in dioxane/water (26 mL, 1:1) at 5 °C. The obtained suspension was stirred for 50 min at 3 °C and ethyl acetate (100 mL) was added. The layers were separated and the aqueous layer was extracted with ethyl acetate (2x75 mL). The combined organic layers were washed with water (20 mL) and brine (30 mL), dried over magnesium sulphate and filtered. Diphenyl ether (30 mL) was added and the ethyl acetate was removed *in vacuo*. The acyl azide solution in diphenyl ether was added during 15 min to diphenyl ether (70 mL) at 215 °C. The reaction solution was refluxed 2.5 h and then stirred at room temperature over night. To the reaction solution was added diethyl ether (100 mL) and the precipitate formed was filtered off and washed with diethyl ether. The precipitate was taken up in methanol/dichloromethane, adsorbed onto silica gel (30 g) and purified by flash chromatography (gradient: dichloromethane:methanol; 98:2 → 95:5). The product containing fractions were combined and concentrated to give a solid. The solid was triturated with diethyl ether, filtered and dried *in vacuo* to give 3.15 g (37% yield) of the title compound. MS *m/z* 200 ( $M^+ + 1$ ).

A biotinylated peptide substrate, Biotin-Ala-Ala-Glu-Glu-Leu-Asp-Ser-Arg-Ala-Gly-Ser(PO<sub>3</sub>H<sub>2</sub>)-Pro-Gln-Leu (AstraZeneca, Lund), was added at a final concentration of 1  $\mu$ M in an assay buffer containing 1 mU recombinant human GSK3 $\beta$  (Dundee University, UK), 12 mM morpholinepropanesulfonic acid (MOPS), pH 7.0, 0.3 mM EDTA, 0.01%  $\beta$ -mercaptoethanol, 0.004 % Brij 35 (a natural detergent), 0.5 % glycerol and 0.5  $\mu$ g BSA/25  $\mu$ l. The reaction was initiated by the addition of 0.04  $\mu$ Ci [ $\gamma$ -<sup>33</sup>P]ATP (Amersham, UK) and unlabelled ATP at a final concentration of 1  $\mu$ M and assay volume of 25  $\mu$ l. After incubation for 20 minutes at room temperature, each reaction was terminated by the addition of 25  $\mu$ l stop solution containing 5 mM EDTA, 50  $\mu$ M ATP, 0.1 % Triton X-100 and 0.25 mg streptavidin coated Scintillation Proximity Assay (SPA) beads (Amersham,

UK). After 6 hours the radioactivity was determined in a liquid scintillation counter (1450 MicroBeta Trilux, Wallac). The inhibition curves were analysed by non-linear regression using GraphPad Prism, USA. The  $K_m$  value of ATP for GSK3 $\beta$ , used to calculate the inhibition constants ( $K_i$ ) of the various compounds, was 20  $\mu$ M.
